Hype vs Enterprise **value**

Hype vs Enterprise **value**

Hype vs Enterprise **value**

Direction > Speed

“Maturity and scale come when experiments turn into infrastructure”

The Fine-Tuning Trap

The early assumption

"To understand our business, the model needs to *be trained* on our business."

Reality check

- High cost
- Frozen knowledge
- Maintenance

Iberdrola's stance

Strategic patience:
Research, test but don't
commit

RAG is the new SQL

Decoupled Architecture

Intelligence separate from Data

Auditable

Source included and can be referenced

Real-Time

Instant knowledge updates

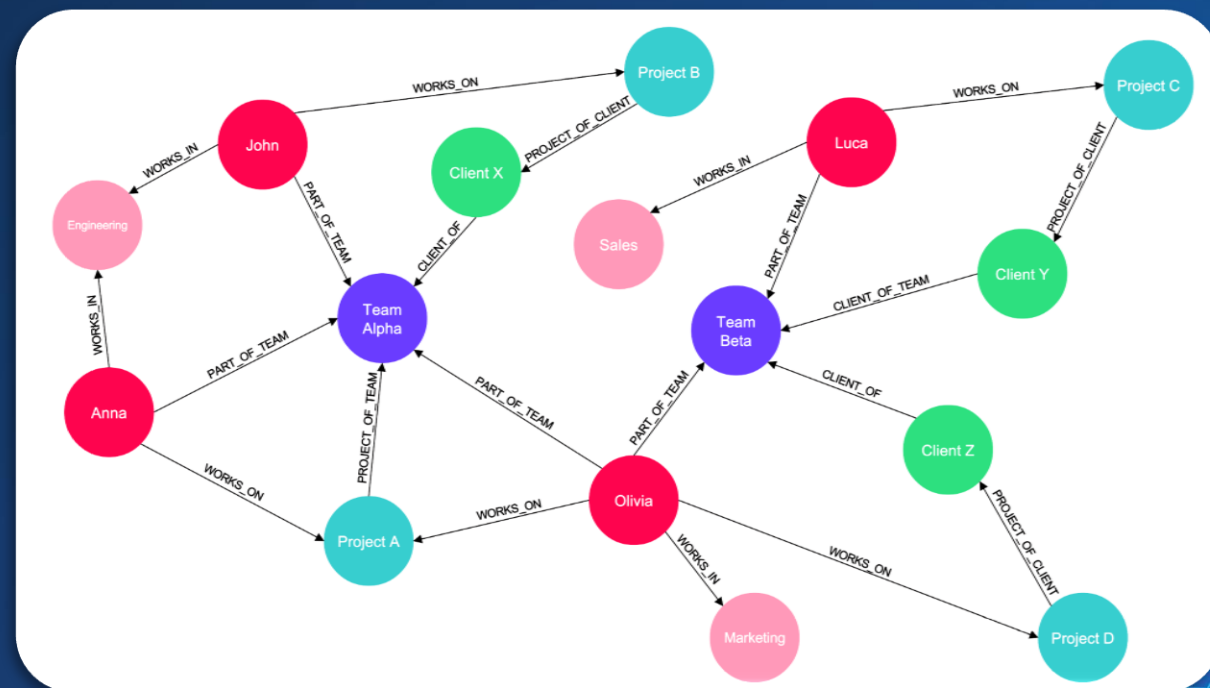

Cheap

Simple to implement and maintain

GraphRAG is...

Graph Retrieval-Augmented Generation enhances standard retrieval by structuring data into a Knowledge Graph:

- **Structure:** Extracts entities (People, Places, Concepts) and relationships.
- **Traversal:** Allows the LLM to "walk" the graph to find indirect connections.
- **Global Context:** Can generate summaries of entire datasets, not just retrieve chunks.

GraphRAG is... an overkill (for us)

Indexing cost

Extracting
entities/relationships via
LLM is slow & expensive.

Complexity

Requires specialized
stack and talent, unlike
the commoditized
Vector DB ecosystem.

Latency

Too slow for real-time
interaction

Our winners

Standard RAG

Our winners

Agentic RAG

**RAG changed the way we retrieve information.
Now, it's time to **act** on it.**

The eternal dilemma

Build complex

VS

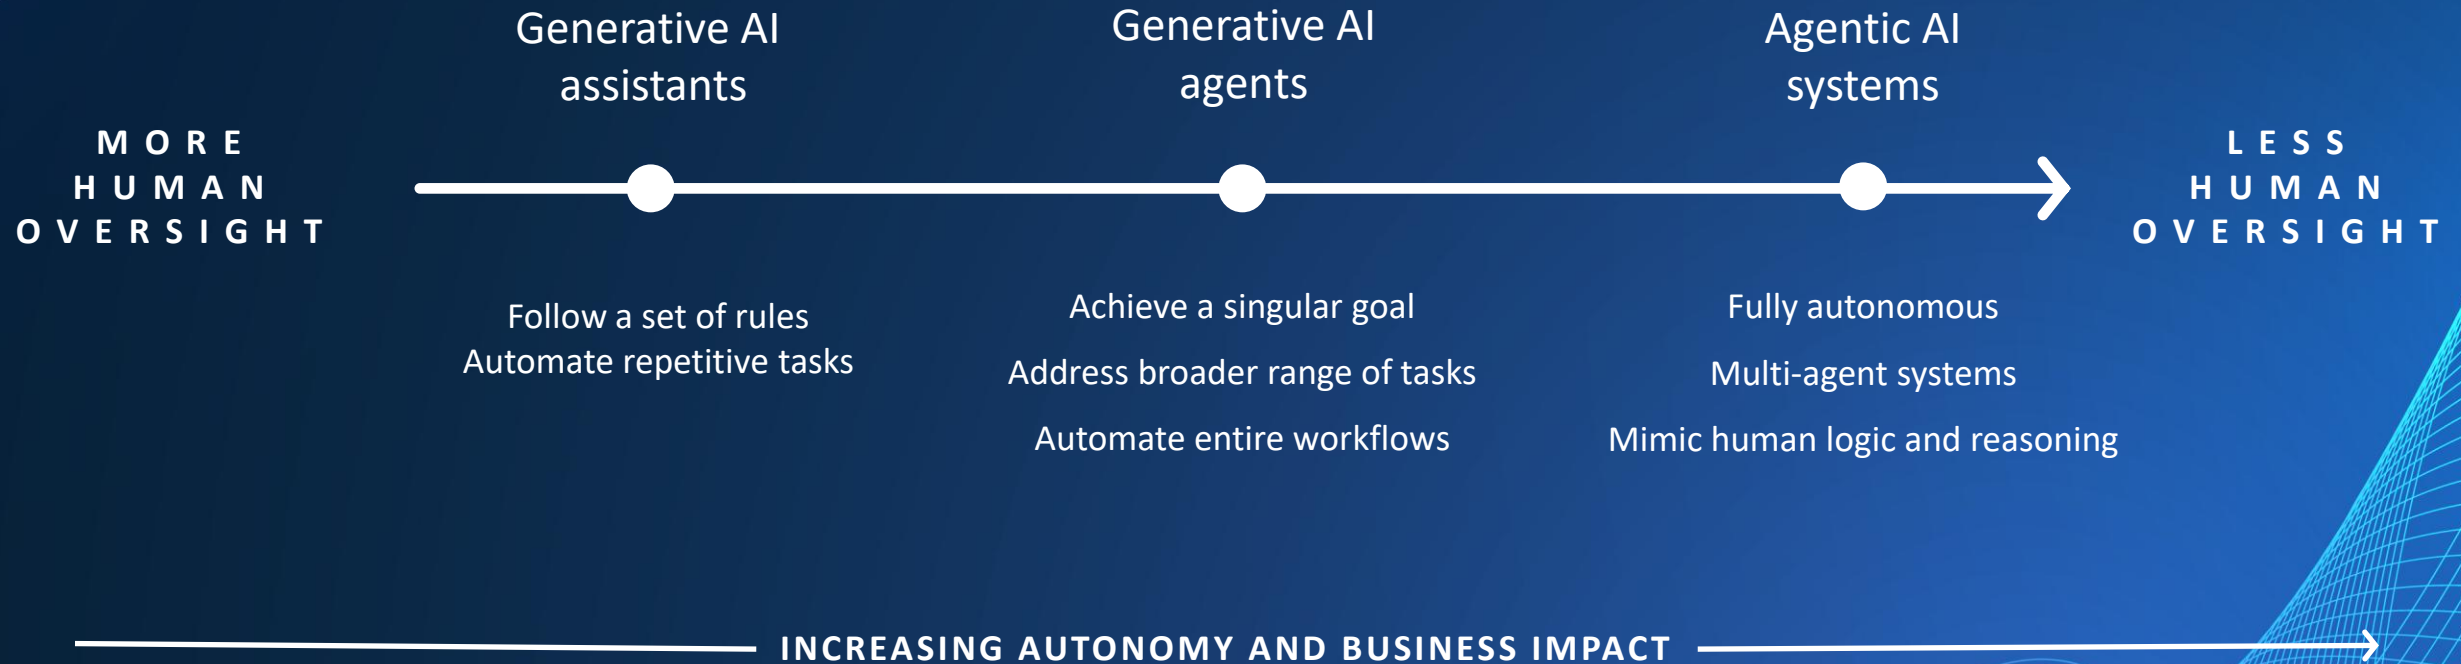

.

Wait for scale

Agents

The evolution into Agentic AI

I need a refund for my last order

Assistant

Drafts & Suggests

Instantly searches the knowledge base for the refund policy and suggests a polite email response for the support agent to review and send.

Agent

Executes & Resolves

Connects to the CRM to verify eligibility, processes the refund directly in the payment system and emails the confirmation to the customer.

Improving IT operations

01

Agent-supported change requests

ServiceNow-based change management agents polish requests drafts, ensuring accurate transitions to approvals while reducing delays and resource waste.

02

Incidents enrichment and smart tagging

Agents enrich networking incidents at ServiceNow with context, boosting tagging, assignment, and resolution speed while significantly reducing manual effort and delays.

03

Intelligent change model selection

A chatbot-like agent, connected to a corporate knowledge base, will help petitioners to choose the appropriate change model. This will reduce human errors, time waste and improve UX.

Thank you!
